

VISUAL AUDIT COMPANION

VoidMap AI Guide

SIMPLE, VISUAL & EASY-TO-UNDERSTAND

An interactive-style visual guide detailing what our project is, how it functions under the hood, and how to understand each component at a glance with live screenshots.

VOIDMAP AI • SIMPLIFIED MANUAL

WHAT WE WANTED TO DO (THE GOAL)

We set out to build an intelligent auditing assistant that detects **missing architecture requirements** (blueprint voids) in project specifications and dynamically simulates the system's risk under hostile conditions.

HOW WE DID IT (THE IMPLEMENTATION)

1. **Setup Blueprints:** Modeled expectation requirements for different domains inside a **Neo4j** graph database.
2. **Isolate Gaps:** Built a backend **Absence Engine** that reads user specs (checklists or plain text) and subtracts them from the blueprints to find Gaps.
3. **Simulate Shocks:** Developed a client-side **Counterfactual Simulator** (interactive sliders) to let users stress test their proposals.
4. **Visualize Cascades:** Built directed node maps to track failure ripples, and compared gaps against real historical disasters.

Here is the plain English dictionary of the platform's core terms, designed to make sense to anyone immediately.

BLINDSPOT INDEX

The "Danger Meter"

A score from 0% to 100% showing how risky your proposal is. More missing safeguards + higher simulator stress = higher Blindspot Index.

EXPECTATIONS COVERAGE

The "Completeness Checklist"

What percentage of expected domain standard features you actually built. If there are 10 standard rules and you build 4, your coverage is 40%.

COUNTERFACTUAL SIMULATION

The "What-If" Sandbox

Interactive sliders that simulate real-world disasters (like cyberattacks or new regulations) to test if your project will break.

CONSEQUENCE RIPPLE TREE

The "Domino Effect" Map

A visual node diagram showing how forgetting one simple security key triggers a chain reaction that crashes your whole system.

DISASTER DNA PROXIMITY

The "Time Machine" Matcher

Compares your missing items to famous past software crashes (like Knight Capital) to warn you if you're about to repeat history.

BOARDROOM CLASH

The "Advisor Debate"

Simulated chat log between virtual advisors (Security vs. Business) arguing over whether to build safety tools or deploy fast.

● PLAIN TEXT TERMINAL MODE

- ****Super Simple Interface:**** Users only input a Project Name, select a Domain, and paste a raw specifications paragraph.
- ****No Complex Fields:**** No need to check individual technical checkboxes; the system reads raw words.
- ****How it works:**** Behind the scenes, the engine scans the text for keywords and matches them to domain expectations.

● GUIDED FORM MODE

- **Structured Checklist:** Users select exact checkboxes representing technologies and active safeguards.
- **Domain Tuning:** Automatically updates fields based on selected domain rules.
- **Target Alignment:** Perfect for systematic design audits when specs are already well documented.

The screenshot displays the VOIDMAP AI ENGINE V1.0 interface. On the left, under 'HISTORIC ANALYSES', there is a card for 'AlphaMed Chest X-Ray CNN' in the 'HEALTHCARE' domain with a '78.5% RISK' level. A red error message at the top right states 'Failed to load this project's detailed gap analysis'. The main form area is titled 'INITIATE ADAPTIVE UNKNOWN-'. It includes a 'PROJECT IDENTIFIER / NAME' field with the example 'e.g. AI Cardiology Cloud Core'. Below this is a section 'CHECK FACTORS YOU HAVE ACTIVELY DOCUMENTED' with checkboxes for 'Security', 'Compliance', 'Accuracy', and 'Value'. The final section is 'PROJECT PROPOSAL TEXT / TECHNICAL SPECIFICATION', which contains a text area with the prompt: 'Provide a detailed description of your architecture. We will parse this text to determine missing requirements.'

● KPI HEADER & DISCOVERY GAPS GRID

- **Instant Indicators:** Displays Blindspot Index and Expectations Coverage at a glance.
- **Export Button:** Contains the safe "Download Audit Report" button at the top right.
- **Gaps Sheet:** Tabulates every unaddressed safety rule, explaining what is missing and its specific downstream hazard.

● COUNTERFACTUAL SIMULATION SANDBOX

- **Disaster Sliders:** Adjust sliders to simulate hostile changes in regulatory focus, technical degradation, or server attacks.
- **Real-time Recalculations:** Scores update instantly to show if your system survives the shock.
- **Scenario Presets:** Buttons lock preset configurations (e.g. Zero-Day Cyberattack) to quickly model events.

● ACTIVE CONSEQUENCE RIPPLE TREES

- **Causal Chain Map:** Renders directed arrows showing the exact path from a missing feature to a crash.
- **Interactive Nodes:** Fit to screen, zoom, and drag nodes to explore cascading security failures.
- **Domino Demonstration:** Visually proves that ignoring small tasks triggers major outages.

● NEO4J GRAPH NETWORK & DOWNLOADED REPORT

- **Neo4j Network Tab:** Visual network mapping addressed (green) vs unaddressed (red) standards query.
- **Downloaded Report:** Generates a structured `.md` file with a list of tasks for the developer.
- **End-User Action Plan:** Developers copy gaps straight into JIRA tickets to resolve and drop risk to 0%.

AUDIT REPORT METRICS:

- BLINDSPOT INDEX: 84%
- LIKELIHOOD OF CRASH: 78%
- ESTIMATED RISK LIABILITY COST: ₹4,500K
